

JURY DOCUMENT

Judging Criteria

TOTAL SCORE PER PROJECT

25 pts

1 Visual Clarity & Communication

5 pts

Does the visualisation make a complex energy concept immediately understandable to a non-technical Brussels household? A great score means someone with no data background can look at the output and genuinely understand something new about their energy bill, consumption, or the grid.

- 5Instantly clear, zero jargon — could be shared on social media as-is
- 3–4Clear with minor friction — small tweaks would make it self-explanatory
- 1–2Requires explanation to be understood
- 0Confusing or inaccessible to a non-technical audience

2 Real-World Impact & Relevance

5 pts

Does the solution address a real, documented barrier to energy transition in Brussels? Is there a credible path to putting it in front of actual households, cooperatives, or policymakers? Bonus weight if the solution directly serves the most vulnerable (renters, low-income households, energy poverty).

- 5Tackles a specific, documented problem — deployment path is obvious
- 3–4Real problem, plausible impact — path to deployment needs work
- 1–2Interesting but tangential — unclear who benefits or how
- 0No clear real-world application

3 Data Integrity & Honesty

5 pts

Are data sources cited and reliable? Are comparisons fair and complete — not cherry-picked? Does the visualisation avoid creating fear or misleading impressions? This criterion is specific to this hackathon's mission: a tool that oversimplifies or distorts, even unintentionally, scores low here.

- 5All data sourced, comparisons honest, uncertainty shown where relevant
- 3–4Mostly sound — minor gaps in sourcing or framing
- 1–2Some misleading elements or unsourced claims
- 0Data misrepresented or fabricated

4 Technical Execution

5 pts

Is the prototype live and demonstrable? Does it work on real data, not mock data? Judges assess what was actually built in one day — ambition is valued, but a working MVP beats an impressive mockup with no data behind it.

- 5Fully working demo on real data — robust and interactive
- 3–4Working demo with some limitations — real data used
- 1–2Partial prototype or mockup — limited interactivity
- 0No working demo

5 Presentation & Storytelling

5 pts

Did the team clearly explain the problem they chose, show their solution, and run a live demo within 5 minutes? Judges assess whether a non-expert in the room understood what was built and why it matters — not just whether the slides were polished.

- 5Problem, solution, and demo delivered crisply — compelling and clear
- 3–4Good structure — minor clarity issues or slight time overrun
- 1–2Hard to follow — demo missing or unclear
- 0No coherent presentation

Note to the jury: Dimension 3 (Data Integrity) is weighted equally to the others — this is intentional. This hackathon's core mission is to make energy data trustworthy, not just beautiful. A visually stunning tool that misleads cannot win.
